# Poultry health matters

## TANZANIA

- Low poultry productivity from diseases
- Lack of trusted poultry data
- Chickens: 36 mil
- Households with chickens: 4.6 mil
- Population: 56.32 mil (2018)

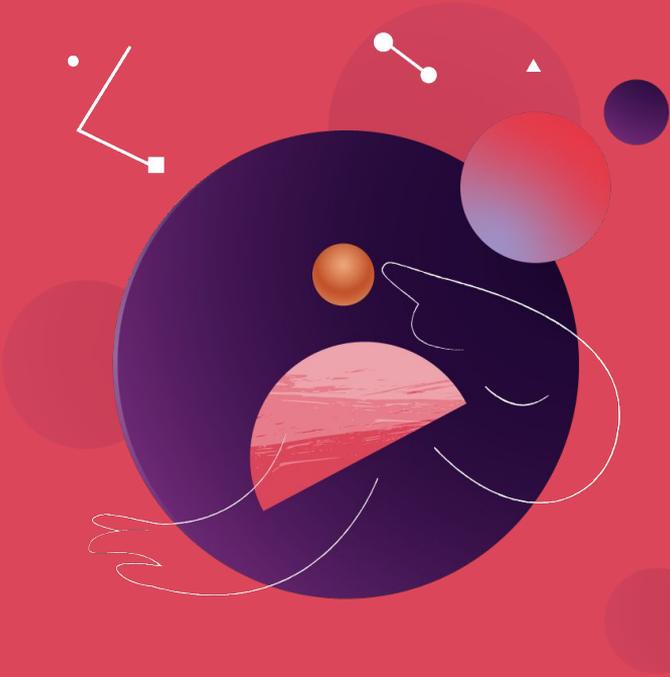

# Diseases Monitoring

Salmonella, Newcastle and  
Coccidiosis chicken diseases:

- Diagnosed by lab procedures using droppings samples
- It takes 3 -4 days to get results
- Clinical signs
- Access to the services by farmers is expensive and limited

01

# Convolutional Neural Networks (CNNs) for poultry diseases diagnostics

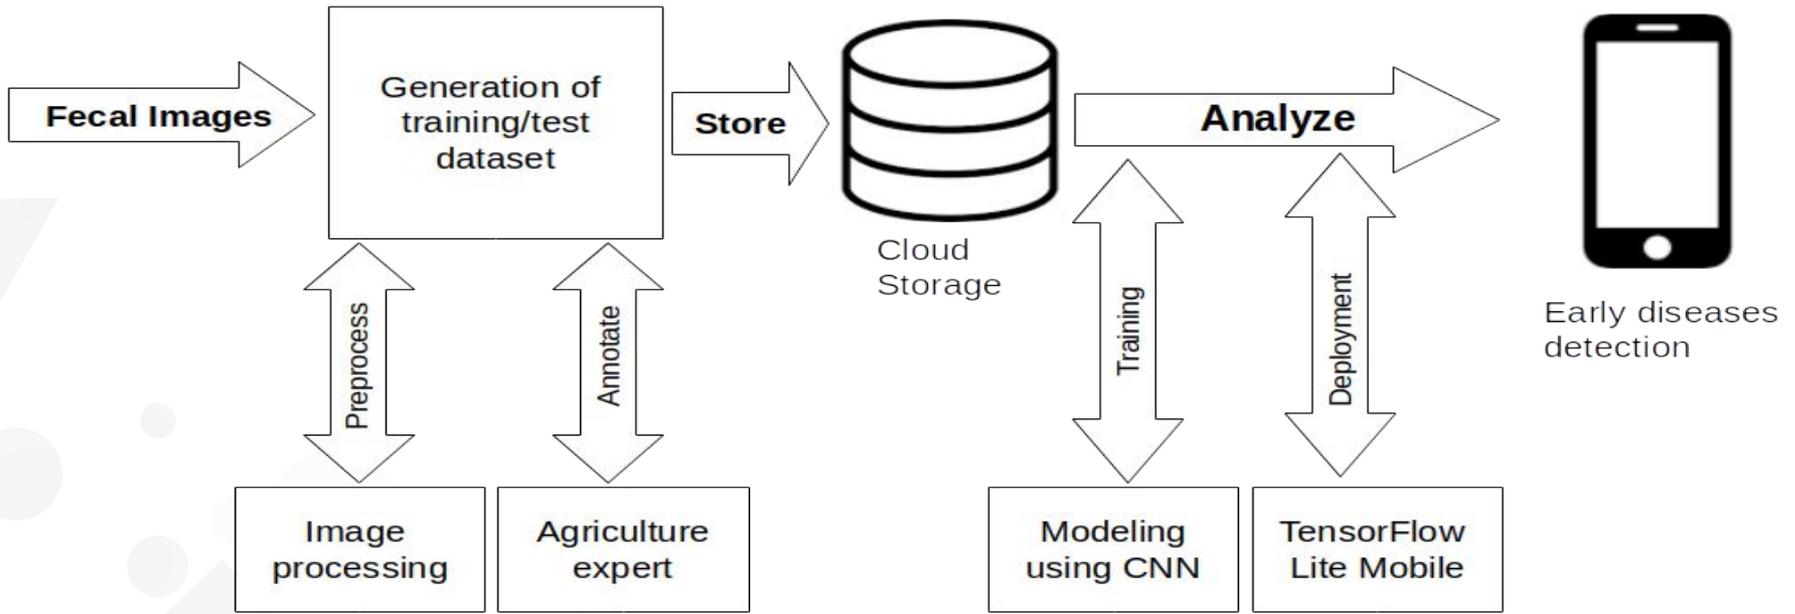

## Task:

Can we train a model that can correctly classify a set of images for chicken diseases?

After training, our model should return the correct label for each image.

# Workflow

# Step 1: Image data collection at farms

# Step 2: Dataset Chicken Droppings Images

Class	# Images
Healthy	2,057
Coccidiosis	2,103
Salmonella	2,276
Newcastle	376
<b>TOTAL</b>	<b>6,812</b>

Salmonella

Coccidiosis

Healthy

Newcastle

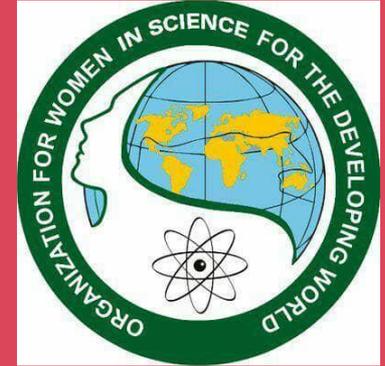

# Step 3: Model training and deployment

- Model training
  - CNN Baseline : 92% accuracy
  - VGG16: 88% accuracy
- The model will be deployed on Android mobile application
  - Access will be Free
- Model will be served on the mobile app
  - To allow usage offline
  - Model updates will be online

“It always seems impossible until it’s done.”

– Nelson Mandela

**THANK YOU**
